

Custom Color Matching On Any Digital Printer at Hyper-Speed!

CATZper2.... How It Works

Every day, clients submit custom color requirements that you are expected to match on your digital printer.

Normally, you print a close PMS match and then chase the client's custom color with CMYK adjustments and swatch tests. This "hit-and-miss" process may take 3 to 6 attempts to get the color close. This costs you hours of valuable production time and materials. **There is a better way!**

CATZper2 software develops a simple grid from a L*a*b* reading of the intended color. This grid is then printed on the digital printer for you or the client to choose the right match.

The matching color will normally be printed on the grid in the first attempt if the color is within the color gamut of the printer. **How much time and material would a spot color match, from the first print, save your company?**

CATZper2 Spot Color Matching System at www.CATZper.com

Stop wasting time guessing what CMYK combination will achieve the closest match to a target spot color. CATZper2 software is a must for any digital printer that frequently needs to reproduce Pantone[®] Colors, corporate colors, or printing company's "standard" colors. CATZper2 is faster than all prior versions and at \$295 will pay for itself in less than 5 uses.
