

FlexTape Plus

What Is It?

SEF's **FlexTape Plus** is a Polyester (PET) transfer tape, with a liner / carrier, designed to transfer Print & Cut heat transfer material to textiles. **FlexTape's** special formulated adhesive is designed to remove printed graphics from its carrier and then at high temperatures, using a heat press, aid in the transfer of the printed graphic to the textile.

FlexTape Plus Advantages:

- The polyester (PET) **FlexTape Plus** and adhesive withstands heat pressing cycles as long as 60 seconds up to 400°F (166°C). *Testing required when exceeding 400F.*
- Protects the surface of printed heat transfer during the heat pressing process as well as during storage and transportation of the graphic.
- Keeps multi-component graphics together during the transfer and pressing process.
- Because of the sticky adhesive, **FlexTape Plus** minimizes the risk of the graphic moving after positioning on the textile before and during the heat pressing process.
- The exceptional clarity aids in alignment of graphics when doing multi heat transfer overlays.
- **FlexTape Plus** removes easily without any adhesive residue after the heat pressing process. Always refer to the printable film manufacturer's recommendation for **FlexTape's** removal, i.e. Hot, Warm or Cold Peel.
- Note: **FlexTape Plus** transfer tapes work well with ALL brands and types of printable heat activated media, not just polyurethane films. Test prior to full production.
- Shelf Life: **FlexTape Plus** has extended shelf-life when stored, up to and may exceed 2 years, in temperatures at or below 80F and not exposed to direct sun for extended periods of time.
